Consumers' Activities for Brand Selection
In the Case of Jewelry/Accessory Purchasing

Kazuhiro Takeyasu*, Chie Ishio**

ABSTRACT

It is often observed that consumers select upper class brand when they buy next time. Suppose that former buying data and current buying data are gathered. Also suppose that upper brand is located upper in the variable array. Then transition matrix becomes upper triangular matrix under the supposition that former buying variables are set input and current buying variables are set output. There may be also the case that customers select lower brand to seek suitable price when they have chosen higher brand. Then it may compose items of lower triangular matrix. Utilizing jewelry/Accessory purchasing history record of on-line shopping over three years, above structure is investigated and confirmed. Some interesting results are obtained. Unless planner for products does not notice its brand position whether it is upper or lower than another products, matrix structure makes it possible to identify those by calculating consumers' activities for brand se-

lection. Thus, this proposed approach enables to make effective marketing plan and/or establishing new brand.

Key word: brand selection, matrix structure, brand position, jewelry, accessory

1. INTRODUCTION

It is often observed that consumers select upper class brand when they buy next time. Suppose that former buying data and current buying data are gathered. Also suppose that upper brand is located upper in the variable array. Then transition matrix becomes upper triangular matrix under the supposition that former buying variables are set input and current buying variables are set output. If the top brand were selected from lower brand in jumping way, corresponding part in upper triangular matrix would be 0. These are verified in numerical examples with simple models. There may be also the case that customers select lower brand to seek suitable price when they have chosen higher brand. Then it may compose items of lower triangular matrix.

If transition matrix is identified, S-step forecasting can be executed. Generalized forecasting matrix components’ equations are introduced. Unless planner for products does not notice its brand position whether it is upper or lower than other products, matrix structure makes it possible to identify those by calculating consumers’ activities for brand selection. Thus, this proposed approach enables to make effective marketing plan and/or establishing new brand.

In this paper, matrix structure is analyzed for the case brand selection is executed for upper class and for lower class, utilizing jewelry/accessory purchasing history record of on-line shopping over three years. Some interest-
Consumers' Activities for Brand Selection  
In the Case of Jewelry/Accessory Purchasing

ing results are obtained. Such research can not be found as long as searched.

Hereinafter, matrix structure is clarified for the selection of brand in section 2. Block matrix structure is analyzed when brands are handled in group and -step forecasting is formulated in section 3. Purchase history investigation of jewelry/accessory on-line shopping is examined and its numerical calculation is executed in section 4. Application of this method is extended in section 5, which is followed by the remarks of section 6.

2. BRAND SELECTION AND ITS MATRIX STRUCTURE

(1) Upper shift of Brand selection

It is often observed that consumers select upper class brand when they buy next time. Now, suppose that \( x \) is the most upper class brand, \( y \) is the second upper brand, and \( z \) is the lowest brand. Consumer's behavior of selecting brand would be \( z \rightarrow y, y \rightarrow x, z \rightarrow x \) etc. \( x \rightarrow z \) might be few. Suppose that \( x \) is current buying variable, and \( x_b \) is previous buying variable. Shift to \( x \) is executed from \( x_b, y_b, \) or \( z_b \). Therefore, \( x \) is stated in the following equation.

\[
x = a_{11}x_b + a_{12}y_b + a_{13}z_b
\]

Similarly,

\[
y = a_{22}y_b + a_{23}z_b
\]

and

\[
z = a_{33}z_b
\]

These are re-written as follows.

\[
\begin{pmatrix}
x \\
y \\
z
\end{pmatrix} = 
\begin{pmatrix}
a_{11} & a_{12} & a_{13} \\
0 & a_{22} & a_{23} \\
0 & 0 & a_{33}
\end{pmatrix}
\begin{pmatrix}
x_b \\
y_b \\
z_b
\end{pmatrix}
\]

Set

\[
(1)
\]
then, $X$ is represented as follows.

$$X = AX_b$$

(2)

Here,

$$X \in \mathbb{R}^3, A \in \mathbb{R}^{3 \times 3}, X_b \in \mathbb{R}^3$$

A is an upper triangular matrix.

To examine this, generating following data, which are all consisted by upper brand shift data,

$$X^i = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}, \quad X_b^i = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}, \quad i = 1, 2, \ldots, N$$

(3)

(4)

parameter can be estimated using least square method.

Suppose

$$X^i = AX_b^i + \epsilon^i$$

(5)

and

$$J = \sum_{i=1}^{N} \epsilon^i \epsilon^i^T \rightarrow \text{Min}$$

(6)

$\hat{A}$ which is an estimated value of $A$ is obtained as follows.
\[ \hat{A} = \left( \sum_{i=1}^{N} x_i x_i^T \right) \left( \sum_{i=1}^{N} x_i x_i^T \right)^{-1} \] (7)

In the data group of upper shift brand, estimated value \( \hat{A} \) should be upper triangular matrix.

If following data that have lower shift brand are added only a few in equation (3) and (4),
\[
X^i = \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix}
\]
\[
X_b^i = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}
\]
\( \hat{A} \) would contain minute items in the lower part of triangle.

(2) Sorting brand ranking by re-arranging row

In a general data, variables may not be in order as \( x, y, z \). In that case, large and small value lie scattered in \( \hat{A} \). But re-arranging this, we can set in order by shifting row. The large value parts are gathered in upper triangular matrix, and the small value parts are gathered in lower triangular matrix.

\[
\begin{pmatrix} x \\ y \\ z \end{pmatrix} \xrightarrow{\text{Shifting row}} \begin{pmatrix} \varepsilon & \varepsilon & 0 \\ \varepsilon & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}
\]

(3) In the case that brand selection shifts in jump

It is often observed that some consumers select the most upper class brand from the most lower class brand and skip selecting the middle class brand.

We suppose \( v, w, x, y, z \) brands (suppose they are laid from upper position to lower position as \( v > w > x > y > z \)).

In the above case, selection shifts would be:
\[
\begin{align*}
\hat{v} & \leftarrow z \\
\hat{v} & \leftarrow y
\end{align*}
\]
Suppose they do not shift to $y, x, w$ from $z$, to $x, w$ from $y$, and to $w$ from $x$, then Matrix structure would be as follows.

$$
\begin{pmatrix}
  v \\
  w \\
  x \\
  y \\
  z
\end{pmatrix} = 
\begin{pmatrix}
  a_{11} & a_{12} & a_{13} & a_{14} & a_{15} \\
  0 & a_{22} & 0 & 0 & 0 \\
  0 & 0 & a_{33} & 0 & 0 \\
  0 & 0 & 0 & a_{44} & 0 \\
  0 & 0 & 0 & 0 & a_{55}
\end{pmatrix}
\begin{pmatrix}
  v_b \\
  w_b \\
  x_b \\
  y_b \\
  z_b
\end{pmatrix}
$$

(9)

3. BLOCK MATRIX STRUCTURE IN BRAND GOURPS AND s-STEP FORECASTING

Next, we examine the case in brand groups. Matrices are composed by Block Matrix.

(1) Brand shift group — in the case of two groups

Suppose brand selection shifts from Corolla class to Mark II class in car. In this case, it does not matter which company’s car they choose. Thus, selection of cars are executed in a group and brand shift is considered to be done from group to group. Suppose brand groups at time $n$ are as follows.

$X$ consists of $p$ varieties of goods, and $Y$ consists of $q$ varieties of goods.

$$
X_n = 
\begin{pmatrix}
  x_1^n \\
  x_2^n \\
  \vdots \\
  x_p^n
\end{pmatrix}

Y_n = 
\begin{pmatrix}
  y_1^n \\
  y_2^n \\
  \vdots \\
  y_q^n
\end{pmatrix}
$$

$$
\begin{pmatrix}
  X_n \\
  Y_n
\end{pmatrix} = 
\begin{pmatrix}
  A_{11} & A_{12} \\
  0 & A_{22}
\end{pmatrix}
\begin{pmatrix}
  X_{n-1} \\
  Y_{n-1}
\end{pmatrix}
$$

(10)

Here,
Consumers' Activities for Brand Selection
In the Case of Jewelry/Accessory Purchasing

\[ X_n \in \mathbb{R}^p (n = 1, 2, \ldots), \ Y_n \in \mathbb{R}^q (n = 1, 2, \ldots), \ A_{11} \in \mathbb{R}^{p \times p}, \ A_{12} \in \mathbb{R}^{p \times q}, \ A_{22} \in \mathbb{R}^{q \times q} \]

Make one more step of shift, then we obtain the following equation.

\[
\begin{pmatrix}
X_n \\
Y_n
\end{pmatrix} =
\begin{pmatrix}
A_{11}^2 + A_{11}A_{12} + A_{12}A_{22} & A_{12} \\
A_{22} & A_{22}
\end{pmatrix}
\begin{pmatrix}
X_{n-2} \\
Y_{n-2}
\end{pmatrix}
\]

(11)

Make one more step of shift again, then we obtain the following equation.

\[
\begin{pmatrix}
X_n \\
Y_n
\end{pmatrix} =
\begin{pmatrix}
A_{11}^3 + A_{11}^2A_{12} + A_{11}A_{12}A_{22} + A_{12}A_{22}^2 & A_{12} \\
A_{22} & A_{22}
\end{pmatrix}
\begin{pmatrix}
X_{n-3} \\
Y_{n-3}
\end{pmatrix}
\]

(12)

Similarly,

\[
\begin{pmatrix}
X_n \\
Y_n
\end{pmatrix} =
\begin{pmatrix}
A_{11}^4 + A_{11}^3A_{12} + A_{11}^2A_{12}A_{22} + A_{11}A_{12}A_{22}^2 + A_{12}A_{22}^3 & A_{12} \\
A_{22} & A_{22}
\end{pmatrix}
\begin{pmatrix}
X_{n-4} \\
Y_{n-4}
\end{pmatrix}
\]

(13)

\[
\begin{pmatrix}
X_n \\
Y_n
\end{pmatrix} =
\begin{pmatrix}
A_{11}^5 + A_{11}^4A_{12} + A_{11}^3A_{12}A_{22} + A_{11}^2A_{12}A_{22}^2 + A_{11}A_{12}A_{22}^3 + A_{12}A_{22}^4 & A_{12} \\
A_{22} & A_{22}
\end{pmatrix}
\begin{pmatrix}
X_{n-5} \\
Y_{n-5}
\end{pmatrix}
\]

(14)

Finally, we get the generalized equation for s-step shift as follows.

\[
\begin{pmatrix}
X_n \\
Y_n
\end{pmatrix} =
\begin{pmatrix}
A_{11}^s + \sum_{k=2}^{s-1} A_{11}^{s-k}A_{12}A_{22}^{k-1} + A_{12}A_{22}^{s-1} & A_{12} \\
A_{22} & A_{22}
\end{pmatrix}
\begin{pmatrix}
X_{n-s} \\
Y_{n-s}
\end{pmatrix}
\]

(15)

If we replace \(n-s \rightarrow n, \ n \rightarrow n+s\) in equation (15), we can make s-step forecast.

(2) Brand shift group — in the case of three groups

Suppose brand selection is executed in the same group or to the upper group, and also suppose that brand position is \(x > y > z\) \((x\) is upper position). Then brand selection transition matrix would be expressed as:

\[
\begin{pmatrix}
X_n \\
Y_n \\
Z_n
\end{pmatrix} =
\begin{pmatrix}
A_{11} & A_{12} & A_{13} \\
0 & A_{22} & A_{23} \\
0 & 0 & A_{33}
\end{pmatrix}
\begin{pmatrix}
X_{n-1} \\
Y_{n-1} \\
Z_{n-1}
\end{pmatrix}
\]

(16)

Where
Here,

\[
X_n = \begin{pmatrix} x_1^n \\ x_2^n \\ \vdots \\ x_p^n \end{pmatrix}, \quad Y_n = \begin{pmatrix} y_1^n \\ y_2^n \\ \vdots \\ y_q^n \end{pmatrix}, \quad Z_n = \begin{pmatrix} z_1^n \\ z_2^n \\ \vdots \\ z_r^n \end{pmatrix}
\]

These are re-stated as:

\[
W_n = AW_{n-1}
\]  
(17)

Where

\[
W_n = \begin{pmatrix} X_n \\ Y_n \\ Z_n \end{pmatrix}, \quad A = \begin{pmatrix} A_{11} & A_{12} & A_{13} \\ 0 & A_{22} & A_{23} \\ 0 & 0 & A_{33} \end{pmatrix}, \quad W_{n-1} = \begin{pmatrix} X_{n-1} \\ Y_{n-1} \\ Z_{n-1} \end{pmatrix}
\]
Hereinafter, we shift steps as is done in the previous section. In the general description, we state as:

$$ W_n = A^{(s)} W_{n-s} $$  \hspace{1cm} (18)

Here,

$$ A^{(s)} = \begin{pmatrix} A_{11}^{(s)} & A_{12}^{(s)} & A_{13}^{(s)} \\ 0 & A_{22}^{(s)} & A_{23}^{(s)} \\ 0 & 0 & A_{33}^{(s)} \end{pmatrix} $$

$$ W_{n-s} = \begin{pmatrix} X_{n-s} \\ Y_{n-s} \\ Z_{n-s} \end{pmatrix} $$

From definition,

$$ A^{(1)} = A $$  \hspace{1cm} (19)

In the case $s = 2$, we obtain

$$ A^{(2)} = \begin{pmatrix} A_{11} & A_{12} & A_{13} \\ 0 & A_{22} & A_{23} \\ 0 & 0 & A_{33} \end{pmatrix} \begin{pmatrix} A_{11} & A_{12} & A_{13} \\ 0 & A_{22} & A_{23} \\ 0 & 0 & A_{33} \end{pmatrix} $$

$$ = \begin{pmatrix} A_{11}^2 & A_{11}A_{12} + A_{12}A_{22} & A_{11}A_{13} + A_{12}A_{23} + A_{13}A_{33} \\ 0 & A_{22}^2 & A_{22}A_{23} + A_{23}A_{33} \\ 0 & 0 & A_{33}^2 \end{pmatrix} $$  \hspace{1cm} (20)

Next, in the case $s = 3$, we obtain

$$ A^{(3)} = \begin{pmatrix} A_{11}^3 & A_{11}^2A_{12} + A_{11}A_{12}A_{22} + A_{12}A_{22}^2 & A_{11}^2A_{13} + A_{11}A_{13}A_{23} + A_{12}A_{22}A_{23} + A_{13}A_{33}A_{33} + A_{13}A_{33}^2 \\ 0 & A_{22}^3 & A_{22}^2A_{23} + A_{22}A_{23}A_{33} + A_{23}A_{33}^2 \\ 0 & 0 & A_{33}^3 \end{pmatrix} $$  \hspace{1cm} (21)

In the case $s = 4$, equations become wide-spread, so we express each Block Matrix as follows.
In the case $s = 5$, we obtain the following equations similarly.

$$A_{11}^{(s)} = A_{11}^{5}$$

$$A_{12}^{(s)} = A_{11}^{5} A_{12} + A_{11}^{5} A_{12} A_{22} + A_{11}^{5} A_{12} A_{22} + A_{11}^{5} A_{12} A_{22} + A_{11}^{5} A_{12} A_{22} + A_{11}^{5} A_{12} A_{22} + A_{11}^{5} A_{12} A_{22} + A_{11}^{5} A_{12} A_{22} A_{23} + A_{11}^{5} A_{12} A_{22} A_{23} + A_{11}^{5} A_{12} A_{22} A_{23} + A_{11}^{5} A_{12} A_{22} A_{23} + A_{11}^{5} A_{12} A_{22} A_{23} + A_{11}^{5} A_{12} A_{22} A_{23} + A_{11}^{5} A_{12} A_{22} A_{23}$$

$$A_{13}^{(s)} = A_{11}^{5} A_{13} + A_{11}^{5} A_{12} A_{23} + A_{11}^{5} A_{12} A_{23} + A_{11}^{5} A_{12} A_{23} + A_{11}^{5} A_{12} A_{23} A_{33} + A_{11}^{5} A_{12} A_{23} A_{33}$$

$$A_{22}^{(s)} = A_{22}^{5}$$

$$A_{23}^{(s)} = A_{22}^{5} A_{23} + A_{22}^{5} A_{23} A_{33} + A_{22}^{5} A_{23} A_{33} + A_{22}^{5} A_{23} A_{33}$$

$$A_{33}^{(s)} = A_{33}^{5}$$

In the case $s = 6$, we obtain

$$A_{11}^{(s)} = A_{11}^{6}$$

$$A_{12}^{(s)} = A_{11}^{6} A_{12} + A_{11}^{6} A_{12} A_{22} + A_{11}^{6} A_{12} A_{22} + A_{11}^{6} A_{12} A_{22} + A_{11}^{6} A_{12} A_{22} + A_{11}^{6} A_{12} A_{22} + A_{11}^{6} A_{12} A_{22} A_{23} + A_{11}^{6} A_{12} A_{22} A_{23} + A_{11}^{6} A_{12} A_{22} A_{23} + A_{11}^{6} A_{12} A_{22} A_{23} + A_{11}^{6} A_{12} A_{22} A_{23} + A_{11}^{6} A_{12} A_{22} A_{23}$$

$$A_{13}^{(s)} = A_{11}^{6} A_{13} + A_{11}^{6} A_{12} A_{23} + A_{11}^{6} A_{12} A_{23} + A_{11}^{6} A_{12} A_{23} + A_{11}^{6} A_{12} A_{23} A_{33} + A_{11}^{6} A_{12} A_{23} A_{33}$$

$$A_{22}^{(s)} = A_{22}^{6}$$

$$A_{23}^{(s)} = A_{22}^{6} A_{23} + A_{22}^{6} A_{23} A_{33} + A_{22}^{6} A_{23} A_{33} + A_{22}^{6} A_{23} A_{33}$$

$$A_{33}^{(s)} = A_{33}^{6}$$

In the case $s = 6$, we obtain

$$A_{11}^{(s)} = A_{11}^{6}$$

$$A_{12}^{(s)} = A_{11}^{6} A_{12} + A_{11}^{6} A_{12} A_{22} + A_{11}^{6} A_{12} A_{22} + A_{11}^{6} A_{12} A_{22} + A_{11}^{6} A_{12} A_{22} + A_{11}^{6} A_{12} A_{22} + A_{11}^{6} A_{12} A_{22} A_{23} + A_{11}^{6} A_{12} A_{22} A_{23} + A_{11}^{6} A_{12} A_{22} A_{23} + A_{11}^{6} A_{12} A_{22} A_{23} + A_{11}^{6} A_{12} A_{22} A_{23} + A_{11}^{6} A_{12} A_{22} A_{23}$$

$$A_{13}^{(s)} = A_{11}^{6} A_{13} + A_{11}^{6} A_{12} A_{23} + A_{11}^{6} A_{12} A_{23} + A_{11}^{6} A_{12} A_{23} + A_{11}^{6} A_{12} A_{23} A_{33} + A_{11}^{6} A_{12} A_{23} A_{33}$$

$$A_{22}^{(s)} = A_{22}^{6}$$

$$A_{23}^{(s)} = A_{22}^{6} A_{23} + A_{22}^{6} A_{23} A_{33} + A_{22}^{6} A_{23} A_{33} + A_{22}^{6} A_{23} A_{33}$$

$$A_{33}^{(s)} = A_{33}^{6}$$

We get generalized equations for $s$-step shift as follows.
Consumers' Activities for Brand Selection
In the Case of Jewelry/Accessory Purchasing

$$A^{(s)} = A_{11}$$

$$A^{(1)} = A_{11} - A_{12} + \sum_{k=2}^{s-1} A_{11-k}A_{12}A_{22}A_{23}^{-1} + A_{12}A_{23}^{-1}$$

$$A^{(2)} = A_{11}^{-1}A_{13} + A_{11}^{-2}\left( \sum_{k=1}^{s-1} A_{11-k}A_{13-k+1}A_{13-k+1} \right) + \sum_{j=1}^{s-2} A_{11}^{2-j}\left[ A_{12} \left( \sum_{k=1}^{j-1} A_{22-1-k}A_{22}A_{23}^{-1} + A_{13}A_{33}^{-1} \right) \right]$$

$$A^{(3)} = A_{22}$$

$$A^{(4)} = \sum_{k=1}^{s} A_{22-k}A_{23}A_{33}^{-1}$$

$$A^{(5)} = A_{33}$$

Expressing them in matrix, it follows.

$$A^{(s)} = \begin{pmatrix}
A_{11} & A_{12} & \cdots & A_{1m} \\
A_{21} & A_{22} & \cdots & A_{2m} \\
\vdots & \vdots & \ddots & \vdots \\
A_{m1} & A_{m2} & \cdots & A_{mm}
\end{pmatrix}
= \begin{pmatrix}
0 & A_{12} & \cdots & A_{1m} \\
A_{22} & 0 & \cdots & A_{2m} \\
\vdots & \vdots & \ddots & \vdots \\
A_{mm} & A_{m2} & \cdots & 0
\end{pmatrix}
$$

(26)

Generalizing them to $m$ groups, they are expressed as:

$$\begin{pmatrix}
X^{(1)}_n \\
X^{(2)}_n \\
\vdots \\
X^{(m)}_n
\end{pmatrix}
= \begin{pmatrix}
A_{11} & A_{12} & \cdots & A_{1m} \\
A_{21} & A_{22} & \cdots & A_{2m} \\
\vdots & \vdots & \ddots & \vdots \\
A_{m1} & A_{m2} & \cdots & A_{mm}
\end{pmatrix}
\begin{pmatrix}
X^{(1)}_{n-1} \\
X^{(2)}_{n-1} \\
\vdots \\
X^{(m)}_{n-1}
\end{pmatrix}$$

(27)

$$X^{(1)}_n \in R^{k_1}, X^{(2)}_n \in R^{k_2}, \ldots, X^{(m)}_n \in R^{k_m},$$

$$A_{ij} \in R^{k_i \times k_j} (i = 1, \ldots, m) \ (j = 1, \ldots, m)$$

4. PURCHASE HISTORY INVESTIGATION and NUMERICAL CALCULATION

Jewelry/accessory purchase history investigation is executed.

First of all, the framework of jewelry/accessory purchasing via on-line shopping is as follows.

- On-line shop: Ciao!/Happy gift
  
  Host site: http://www.happy-gift.jp/
  
  Branch site: http://www.rakuten.co.jp/ciao/
  
  http://store.shopping.yahoo.co.jp/b-ciao/index.html
Managed by Cherish Co.Ltd.

- Customers: all over Japan (Every Prefecture)
- Data gathering period: October 2006 – May 2009
- Order number: 2438 (limited to the order number which has repeated order)
- Main residents of customers

The shift of N1 to N2 in $X_b$, $X$ is expressed as follows when one event arises.
Consumers' Activities for Brand Selection
In the Case of Jewelry/Accessory Purchasing

Therefore the vectors $\mathbf{X}, \mathbf{X}_b$ in these cases are expressed as follows.

1. $\mathbf{X} = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 1 \\ 0 \end{pmatrix}, \quad \mathbf{X}_b = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}$

2. $\mathbf{X} = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 1 \\ 0 \end{pmatrix}, \quad \mathbf{X}_b = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}$

3. $\mathbf{X} = \begin{pmatrix} 0 \\ 1 \\ 0 \\ 0 \end{pmatrix}, \quad \mathbf{X}_b = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}$

4. $\mathbf{X} = \begin{pmatrix} 0 \\ 1 \\ 0 \\ 0 \end{pmatrix}, \quad \mathbf{X}_b = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}$

5. $\mathbf{X} = \begin{pmatrix} 0 \\ 1 \\ 0 \\ 0 \end{pmatrix}, \quad \mathbf{X}_b = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}$
\[ \begin{align*}
\text{(6)} \quad & X = \begin{pmatrix} 1 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}, & \quad X_b = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 1 \\ 1 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix} \\
\text{(7)} \quad & X = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 1 \\ 1 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}, & \quad X_b = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 1 \\ 1 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix} \\
\text{(8)} \quad & X = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 1 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}, & \quad X_b = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 1 \\ 1 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix} \\
\text{(9)} \quad & X = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 1 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}, & \quad X_b = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 1 \\ 1 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix} \\
\text{(10)} \quad & X = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 1 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}, & \quad X_b = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 1 \\ 1 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix} \\

\]

Total number of upper shift from N1: 71
Total number of lower shift from N1: -
Total number of upper shift from N2: 49
Total number of lower shift from N2: 33
Total number of upper shift from N3: 20
Total number of lower shift from N3: 33
Total number of upper shift from N4: 7
Total number of lower shift from N4: 31
Total number of upper shift from N5: 1
Total number of lower shift from N5: 21
Total number of upper shift from N6: -
Total number of lower shift from N6: 8

We can observe that upper shift from N1 and N2 is dominant and on the contrary, lower shift from N3, N4, N5 and N6 is dominant. This implies that customers buy rather cheap goods at first for the trial, and after confirming the quality, they make upper shift in selecting brands. After reaching higher brands, they buy cheaper goods and that leads to a lower shift in brand selection.

Hearing from customers, we can also find that they buy necklace for themselves and confirm the quality. After that, they make gift by selecting upper brand. Sometimes they buy lower brand goods for themselves after making gift.

That scene can often be seen and the result shows its sequence well. When the shop owner introduces new brand goods, he/she has to determine the price. If it is not reasonable, customers do not select their brand position as the shop owner assumes. These are confirmed by the brand shift transition, which forces the shop owner to re-consider the price and brand position of the new brand goods.

5. APPLICATION OF THIS METHOD

There may arise following case. Consumers and producers do not recognize brand position clearly. But analysis of consumers’ behavior let them know their brand position in the market. In such a case, strategic marketing guidance to select brand would be introduced.

Setting in order the brand position of various goods and taking suitable marketing policy, enhancement of sales would be enabled.

6. REMARKS

The retailer and customers including authors discussed about jewelry/accessory on-line shopping based upon their own experiences. Some of them imply the reason of the lower shift from the higher ranked brand. Some of them suggest the future works to be investigated. Nearly 70% customers
Consumers' Activities for Brand Selection
In the Case of Jewelry/Accessory Purchasing

are men and they mainly purchase jewelry/accessory for gift. Therefore analysis for men becomes dominant in the following discussion.

<In the case male buys>
a. He usually has budget range in making present to his lovers. Therefore there often happens buying the same range level of brand.
b. He is apt to spend much money at the first present. But from the second, it would decrease. —There are Japanese saying that he does not give much food to the fish he caught. When the lover is changed, this scheme would be repeated.
c. Budget may change according to the characteristics of the event. If it is a Xmas or a birthday present, the budget is high and less for those of the white day or other events.
d. If he buys presents with other goods (for example, necklace and flower etc.), jewelry/accessory price would decrease even if the total budget increases.
e. Male is not so severe to the price whether it is qualified or not for its quality.
f. If he buys goods at the real shop, a saleswoman would recommend the goods and he would be apt to buy much higher one than those at the virtual shop.
g. In the case of the couple of separated ages, male is apt to show off, therefore brand selection of upper shift is often the case.
h. After married, brand selection of upper shift is rare for his wife in making present.
i. While young, he makes upper shift after having relationship with partner for about one year. After that, it tends to make lower shift.
j. Male is often simple-minded. Therefore, if she is glad at the present, he repeats the item, not considering another choice.

<In the case female buys>
k. She makes confirmation of the goods about how it would be at the first purchasing. If she is satisfied, then she makes repeated purchasing. If the goods is well, she also buys them for herself.
l. The price of goods may not change for female whether she buys at the real shop or virtual shop.
7. CONCLUSION

It is often observed that consumers select upper class brand when they buy next time.
Suppose that former buying data and current buying data are gathered. Also suppose that upper brand is located upper in the variable array. Then the transition matrix becomes upper triangular matrix under the supposition that former buying variables are set input and current buying variables are set output. There might be also the case that customers selected lower brand to seek suitable price when they had chosen higher brand. Then it might compose items of lower triangular matrix. Utilizing jewelry/accessory purchasing history recorded of on-line shopping over three years, above structure was investigated and confirmed. Some interesting results were obtained.

Unless planner for products does not notice its brand position whether it is upper or lower than another products, matrix structure makes it possible to identify those by calculating consumers' activities for brand selection. Thus, this proposed approach enables to make effective marketing plan and/or establishing new brand.

Various fields should be examined hereafter.

In the end, we appreciate Ms. Saika Ogura for her helpful support of work.
